

Galileo Galilei

Born Pisa 1564
Died Florence 1642

ASSA Symposium
Durban
August 2008

Grand Duchy of Tuscany (Under domination of the Papal States)

Birthplace of Galileo - Pisa

Vincenzio Galilei – Galileo's father

Experimenter and musical theorist

Education

- **Camaldolese (Benedictine) monastery of Vallombrosa**
- **Private teachers**
- **University of Pisa – medicine and Aristotelian philosophy**

Galileo's life - Timeline

- 1564 birth in Pisa (Grand Duchy of Tuscany)
- 1581 studies medicine
- 1585 studies geometry - teacher in Florence
- 1587 visits Rome
- 1589-1592 Prof at Pisa
- 1592-1610 Prof at Padua (Rep. of Venice)
- 1597 Convinced of Copernicanism
- 1603 acceleration of falling bodies
- 1604 Kepler's supernova
- 1609 first telescope
- 1610 publishes Sidereus Nuncius
- 1610 Prof in Pisa; Philosopher to Grand Duke of Tuscany
- 1613 publishes book on sunspots
- 1615 publishes views on the Bible
- 1615 first problems with church
- 1618 comets
- 1623 publishes *The Assayer*
- 1632 publishes *Dialogue* favouring Copernicanism
- 1633 Trial by Inquisition; house arrest
- 1638 Publishes *Discourse on Two New Sciences*
- 1637 libration of the Moon
- 1637 blindness
- 1642 death in Arcetri near Florence

Florence – Renaissance City

Visit to Rome (1587)

Collegio Romano, intellectual HQ of the Jesuit Order

Clavius (Christopher Clau SJ)

- Mathematician behind the Gregorian calendar promulgated by Pope Gregory XIII in 1582.
- Impressed with Galileo's work on centres of gravity.

Another picture!

Pisan Professorship 1589-1592

- Beginnings of experimental work; inclined planes etc.
- Beginnings of concept of inertia
- Anti-establishment, especially Aristotelians
- Poem: “Against wearing gowns”

University of Pisa

Pisan legends!

Aristotelian science

The bane of the late Middle Ages – supported vociferously by the academic world and many theologians

- The earth is the centre of the universe; the sun and other bodies revolve around it.
- Terrestrial substances are composed of earth, air, fire and water but the heavens are made of of a “perfect” material
- No changes occur in the heavens
- Heavenly bodies move only in perfect circles or combinations thereof
- Ptolemaic theory: invisible spheres support and drive the planets, whose motions can be described by epicycles
- Observation unimportant compared to logic

Padua 1592-1610

Venetian Republic – intellectually free

Paduan professorship 1592-1610

Copernicus published his *De Revolutionibus* ... in 1543.
Not accepted until Kepler and Galileo's times

Johannes Kepler's supernova of 1604

First portrait of Galileo?

- 19th century engraving of a supposedly lost 1603-1604 portrait.
- Can it be genuine?
- -----
- Marina Gamba
- 3 children
- -----
- Best science
- Many private pupils

Invention of the telescope

- October 2, 1608: Hans Lippershey of Middelburgh, Netherlands, a spectacle maker, applied for a patent on a telescope.
- There were other claimants and Lippershey's application was denied.

Advent of the telescope

- Galileo heard of telescope in July 1609 and guessed how it is made. Grinds own lenses.
- Sold an 8-power model as a military instrument to the Venetian government, receiving tenure and a huge increase in salary.
- By November 1609 had a 20-power instrument.

Wooing the Venetian government

Astronomical discoveries – lunar mountains

Adh. 7. d. Gennaio 1610 Giove si vedeva col Carbone ed
 3. stelle fisse, cioè \odot \ominus \oplus , delle quali restò il comuno
 minor si vedeva. \odot \oplus \ominus a di. d. appariva così \oplus \ominus \odot era dug.
 diretto et non retrogrado come dicono i calcolatori.
 Adh. 9. fu rugolo, a di. 10. si vedeva così \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot
 più o in più occidentale si che la risultava quanto si può credere.
 Adh. 11. era in questa guisa \oplus \ominus \odot et la stella più vicina
 a Giove era la metà minore dell'altra, et vicinissima all'altra
 come che le altre pare erano le dette stelle appaite tutte tre
 di equal grandezza et tra di loro equalo lontore; dal che
 appare intorno a Giove esser 3. altre stelle erranti invisibili ad
 ogni uno s'io a questo tempo.
 Adh. 11. si vedde in tale costituzione \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot era la stella
 occidentale poco minor dello orientale, et Giove era in mezzo lontano
 tra l'una et dall'altra quarto il suo diametro è circa: et forse era
 una terza più che et vicinissima a \oplus verso oriente; anzi pur in era
 verso \oplus hancato et si fu di più diligenza osservato, et era più imbrunita la
 notte.
 Adh. 13. havendo formati lo stormi si veddono vicinissimi a Giove
 4. stelle in questa costituzione \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot
 e tutte apparivano della medesima grandezza, lo spazio delle 7. occidentali
 ad era maggiore del diametro di \oplus . et erano tra di loro notabilmente
 più vicine che le altre sore; ne erano in linea retta equidistanti come
 si può in la media dello zodiacale era in poco elevata, ovvero la
 più occidentale alquanto depressa; sono queste stelle tutte molto vicine
 vicinissime et altre siue et apparivano della medesima grandezza et sono
 così splendide.
 Adh. 14. fu rugolo. Adh. 15. era così \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot a \oplus \ominus \odot \oplus \ominus \odot
 7. era la minore et le altre di mano e mano maggiori: gli interstizii
 tra 4. et la 3. seguiva erano, quanto il diametro di \oplus . ma la 7. era di
 parte della 3. il doppio circa; ad fine
 7. long. 71. 38 lat. 1. 13. \odot \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot
 erano in una linea retta, ma come mostra
 l'esempio, erano al tutto invisibili se le più
 7. \odot \oplus \ominus \odot \oplus \ominus \odot \oplus \ominus \odot et molto vicinissime come si può

GREAT AND WONDERFUL

Sights displayed for all to see but

especially for

PHILOSOPHERS and ASTRONOMERS by

GALILEO GALILEI

PATRICIAN OF FLORENCE

Public Mathematician of the University of Padua

By means of a

PERSPICILLUM

Newly devised by him, there are observed the surface
of the moon, innumerable fixed stars, the Milky Way and
nebulous stars, but especially

FOUR PLANETS

flying around Jupiter at unequal distances and periods

Which, never seen before, have recently been seen for the first
time by the author and named by him as

MEDICEAN STARS

Venice, at Thomas Baglionum, 1610

With permission and privilege

Return to Medici court in Florence 1610

- Cosimo II de Medici with wife and son Ferdinando II

Portrait of Galileo 1610 - 1615 (aged 46 - 51)

- Considered to be by the Venetian painter Domenico Robusti, son of “Tintoretto”.

Phases of Venus – end of 1610 (strong proof of Copernican viewpoint)

Saturn and its rings

1610

1616

- Galileo's telescope did not have enough resolution to see the rings properly.
- In 1612 they had disappeared (now known they were edge-on)

Sunspot drawings 2 June - 8 July 1613

Projection telescope invented by Galileo's pupil Benedetto Castelli;

Also used by his rival sunspot observer Christopher Scheiner SJ

Beginnings of trouble with the Church

- In December 1613, Grand Duchess Christina, at a dinner party, questioned Galileo's pupil Castelli about Galileo's orthodoxy.
- Attacked from the pulpit in Florence in 1614 by Tomaso Caccini, a Dominican priest.
- Galileo was Reported to Cardinal Bellarmine of the Holy Office (Inquisition). He was a known anti-Copernican
- Galileo wrote a "letter" to the Grand Duchess defending his views.

Cardinal Bellarmine and the Inquisition

- The Inquisition was asked by Pope Paul V to check up on whether the motion of the earth was in accord with biblical teaching – report was negative.
- Bellarmine, its leading theologian, warned Galileo that Copernican views were contrary to scripture and could not be defended or held.
- However, they could be referred to as a model useful in making calculations.

Il Saggiatore (the Assayer), written in 1623

- “Philosophy is written in the greatest book, one that stands open before our eyes (I speak of the universe). But it cannot be comprehended without first understanding its language and knowing the characters in which it is written. That language is mathematics, and its characters are triangles, circles and other geometric figures. Without these, it is humanly impossible to understand the words; without these, one wanders vainly about in a dark labyrinth.”

- Galileo's Dialogue concerning the two great world-systems, the Ptolemaic and the Copernican, published in 1632.

Libration of the Moon (1637)

What Galileo really thought - letter of 1641 to a friend

- The falsity of the Copernican system ought not to be doubted in any way, and most of all not by us Catholics who have the undeniable authority of Holy Scripture, interpreted by the best theologians.
- If the observations and conjectures of Copernicus are insufficient, those of Ptolemy, Aristotle and their followers are in my view even more false.

Final tomb, Santa Croce

- Galileo died in 1642
- He was at first refused burial in Santa Croce because of his “heretical” views.
- Remains placed in this tomb in 1737. The tomb was paid for by his pupil Vincenzo Viviani.

Scientific saint

Relics – finger (left, in IMSS, Florence) and vertebra (right, University of Padua)

Galileo's Legacy

- Scientific method
- Concept of inertia
- Understanding of accelerated movement
- Strength of materials
- Validity of Copernican universe
- Relations between religion and science

The End
